Virtual Consultations may also be available, talk to your local Dominator Dealer to find out more. Our Easy 5 Step Process Dominator Inspiration Gallery Our Easy 5 Step Process Dominator Inspiration Gallery By continuing to use our website you are agreeing to our Privacy Policy. If you have a question that isnt answered below, please feel free to contact us. To programme your garage door remote, please follow the instructions below To use the manual release on your opener, please watch our instructional video here. The Dominator GDO range contains an autoreverse function. This means if your garage door comes into contact with something when it is opening or closing, it automatically stops. You can also fit safety infrared beams to your garage opener. If the safety beam is broken either by a child, pet or vehicle whilst the door is closing, the door will stop and reverse without making any contact with the obstruction. How can I access my garage without a remote control. When you install a Dominator Entry Keypad to your automatic garage door, your entire family can easily gain access using their pin number. An entry keypad is especially handy if you are popping out for a run and dont want to carry any keys with you or risk one of your children losing the spare remote. If mains power isnt available to your garage door, you can use our SmartSolar Charging Option. Below are our most frequently asked questions. If your question is not below, please feel free to contact us. Please feel free to contact us. A garage door is the largest moving object in your home and because of the large number of small parts; its installation is highly technical. Connecting the springs can be particularly dangerous and proper installation is critical to the performance of your door. One of the other services a professional installer can provide is the disposal of your old door, if you are replacing a door. Professional installers can typically install a door in a few hours and are careful to make sure safety requirements are met. Installations by most homeowners typically span several days and cause much frustration. In addition, incorrect installation can void certain warranties, so we recommend a professional

handle the job for you. Will my Dominator dealer take care of that Discuss this with our salesperson when you get your estimate on your new door. We can make any width in between, in five millimetre increments. Note not all models available in all sizes Newer electric openers function as the lock, making it unlikely that an intruder would be able to lift your door from the outside.http://eagleexpressegypt.com/userfiles/8051-microcontroller-reference-manual.xml

If you have an older opener, check to see if your door can be lifted from the outside. We do not recommend that you install a lock with an opener, because someone accidentally may try to automatically open the door when it is physically locked, possibly causing damage. You should consider a lock if you do not intend to have an automatic opener. Operate the door manually in order to determine how easy it is to open. Remember that an electric garage door opener is only meant to work as a substitute for human strength. You must therefore avoid placing any unnecessary strain on it. If the door is hard to open when operated manually, get in touch with a Dominator Dealer. This sort of problem may result from a decompressed spring, a warped track, or a loose cable. If so equipped, it is a good idea to check the photoelectric protection system as well to make sure it is working properly. Please feel free to contact us. He has also edited and written multiple articles and books on the topic. If none of the following fixes seem to correct the problem, you will need to consult the owners manual or contact a professional. Begin by checking the outlet where the door opener is plugged in, and make sure the cord is plugged in all the way. Its also possible that the circuit breaker, fuse, or GFCI outlet powering the door opener circuit has tripped or burned out. If you find that other lights or electrical circuits in the garage arent operating, this is the likely cause, and youll need to reset the breaker or GFCI or replace the burnedout fuse. If the circuit breaker or GFCI is tripping repeatedly, its a sign that there is a short circuit somewhere in the system—possibly even the garage door opener itself. Finally, its possible the garage door openers motor has burned out and isnt operating at all. This is a problem that will require you or a service person to replace it. Its possible you are out of range of the antenna inside the garage.

Modern garage door openers are essentially small radios that operate at about 315mH, and a few feet of extra distance can affect the signal. Make sure that the antenna on the motor unit is hanging downward and is not damaged in any way. If the door functions fine with the hardwired wall switch, its likely the battery needs replacing in the remote control or keypad. Reprogram the remote control or keypad. The sensitive electronics in the remote control or keypad can sometimes lose its programming and may need to be reset. Each garage door opener has a slightly different method of reprogramming, so consult the instructions or look online for information on how this is done for your particular opener. Your garage door has setlimit switches that instruct the motor when to stop running—both when it is opening, and when it is closing. If the closelimit switch is set wrong, it may prevent the door from closing It can also cause the opener to reverse or pull back up when you attempt to close it. Adjusting the limit switch will stop your garage door from behaving erratically. Near the bottom of the door track on both sides are electronic eyes that require a clear line of view between them. If the sightlines are clear between the eyes, the door will close smoothly all the way to the floor. However, if anything is blocking the sightline, or if the brackets holding the electronic eyes are out of alignment, the door will fail to descend all the way. In most cases, the door will stop or reverse, and lights will flash to tell you there is a problem. Sometimes, leaves or debris can block the sensors; it if happens frequently, it might be that vibrations from the door in the tracks are loosening the brackets holding the sensors and must be realigned. Replacing damaged rollers or lubricating them with silicone lubricant can correct this problem. Sometimes the tracks themselves may shift or get bent, which can also cause the problem.

http://ninethreefox.com/?q=node/15947

When the door reverses before it even hits the floor, this is often because the closeforce setting needs adjustment. The friction of the door rollers within the tracks is fooling the door opener into

thinking the door has reached the floor, and the opener needs to be adjusted for less sensitivity. Damaged or rusted rollers can also create extra friction, fooling the door opener into stopping prematurely. Make sure the rollers are in good shape and well lubricated to prevent this problem. Adjust the closelimit adjustment screw on the door opener motor in small increments until the door stops upon touching the floor. This switch is usually a simply touchlever mounted on the end of the track near the motor unit, and if it is too far away, the motor will stop the door before it fully opens. The solution is to move the switch closer to the motor unit. This is a somewhat rare problem, and will usually show itself immediately after a new garage door opener is installed. Balky or damaged rollers can also cause the door to stop short of fully opening. Inspect and replace damaged rollers, and lubricate rusty ones. If this happens, look for a screw on the motor unit to adjust the sensitivity of the opener. Especially in winter, when rollers sometimes get stiff, the door opener might be refuse to open. Lubricating rollers can also help with this problem. Methods for adjusting sensitivity vary; so consult the owners manual for directions. It is rare for this problem to suddenly appear; if it happens at all, it will usually be noticed when you first install the garage door opener. I googled to find a local supplier and up popped Garage Door Restore. I ordered the remotes on Monday and they arrived on Tuesday. The ordering process was simple and easy BUT that was nothing compared to how easy it was to program the new remotes. They look really classy and are very sturdy. I programmed them in 10 seconds.

I am so happy with this company, both with their outstanding service and the excellent quality of the product they supplied AND what a fantastic price. Highly recommend Garage Door Restore. " "2 new remotes arrived today. Great service, fantastic price and excellent product. Cannot recommend you guys highly enough." Our installation teams have experience dating back to the very first automation systems introduced into SA in the early 1980's making it possible for us to repair most makes of Garage and gate motors. We have had our own garage motors manufactured and they are available with battery backup which has become ever so popular after the power outages which effected most areas in South Africa. We also stock the ET range of gate motors and remotes which are extremely efficient and well priced for the SA market. We also design and manufacture sliding gates, burglar bars and other steelwork products which are galvanized and installed to our client's specifications. Our knowledgeable staff allow clients to look through possible design's and colors to suit their properties. We also stock replacement remotes and receivers which are available to the public at wholesale prices. Clients are welcome to bring their old automative products which we will guote on repairing at no charge. We are small enough to give fast, efficient service and big enough to give our clients the security of knowing their automation needs are in good hands. This becomes necessary when there is a power failure or, for some reason, you lose your remote. The bypass disconnects the door from the powered carriage, but it stays on the track. Once you disconnect it, you can then lift it manually. When the power comes back on or you locate your lost remote, you can lock the bypass and use the door normally again. Place a ladder under the chain that operates the garage door. Locate a red cord hanging from a bracket on the chain. These cords are almost always red, but if there is only one cord and its not red, its probably the right one. The cord will have a plastic red knob on the end. Most often, the cord is located close to the door. Jerk on the cord using the knob. The cord is hooked onto a small lever. The lever may be tilted at a 15degree angle or pointing straight down.

You will feel that the lever is springloaded; pull the cord until the lever locks in the down position. Step down from the ladder. Grab the door with both hands and lift it. If the door will not budge, pull the cord harder until it locks open. If the door is too heavy for you to lift, dont hurt yourself. Get an assistant to help you lift it. Do not let go of the door once its off the ground. It is free on the track and it will fall if you let go. Prop the door open using a twobyfour or have someone hold the door open for you while you drive your car in or out. When youre finished with the door, ease it down by hand. Pull down on the cord hard to lock it in place again after the power comes back on or you find your remote. Pull on the cord and watch as the bracket slips back into the chain bracket, locking the door into the powered carriage. Try the remote. If the door wont open, but the chain is moving, pull on the chain again until the bracket locks. Test and pull the cord again if necessary to lock it. Tip Keep the rollers and chain lubricated on your garage door. It makes the door operate guiet, and makes the chain and all moving parts last longer because they operate with less friction. Keep your owners manual on hand. Consult it first before tinkering with your door. Warning Never pull the bypass cord if the door is stuck in the open position. The door will come crashing down with enough force to damage anything that gets in its way. Things Needed Ladder Warnings Never pull the bypass cord if the door is stuck in the open position. The door will come crashing down with enough force to damage anything that gets in its way. Tips Keep the rollers and chain lubricated on your

garage door. It makes the door operate quiet, and makes the chain and all moving parts last longer because they operate with less friction. Keep your owners manual on hand. Consult it first before tinkering with your door.
