Brainbench uses interitem consistency While this is While not a direct This testing approach For additional information on our CAT engine, you can download our CAT. Technical Manual. Each manual is For many assessments, we also have. It is not currently accepting answers. Update the question so its on topic for Stack Overflow. I was wondering perhaps it is some sort of customized solution for employers. I am pretty good with some of Boost libraries but have no or very basic knowledge of

others. Does it even make sense to test for the knowledge of a set of libraries such as boost itself? Most of the Brainbench tests are humbug and useless to differentiate a good coder from another. Some of the questions are downright silly and only someone who debated the spec would probably know the answer off the top of their heads. I suspect it is similar for Boost.

<http://www.metanoiaconsultantsglobal.com/images/72-chevelle-manual-steering-box.pdf>

Not only are there so many libraries, but they span such a large range of computing issues that I have doubts as to the utility of such a test. I would suggest you master the main components of boost that are popular: smart pointers, bind, function, lambdas, any, regex, casting, and maybe even threads. I wouldn't worry about the more specific libraries such as MPI or the math libs and what not. The Boost library collection is so large that I doubt if any one person ever uses even 20% of them. Still, on the bright side, you are highly likely to know more than the people at Brainbench do. To see if it was worthwhile, I was asked to take the SQL test and I had a good passing, but not exemplary score. That's without ever having used SQL. I just used common sense and test-taking skills. That tells me that Brainbench measures test-taking skills and not necessarily expertise in a particular subject. They are multiple-choice questions. Possibly also the number of times you change your answer. My ability to craft code isn't based on what I can exactly recollect from boundless libraries but instead what I can do with algorithms, tests, error checking, etc. You wouldn't believe the number of 8s on a 110 scale who can't write hello, world in their chosen language. Finally, if the purpose of the test is to check the breadth and depth of your knowledge within Boost, to be used as a baseline for responsibilities and future training, that COULD be a reasonable use. NOT the other way around. All of which would make me worried. Companies with bad hiring practices usually make other mistakes in treating their employees as well.
